## **Telemedicine**

The delivery of medical services is now perceived differently by patients and medical professionals due to telemedicine. Thus, the technologies deserve special attention as a way towards perfection and progress. In order to give the patient with medical support, doctors, nurses, and other telemedicine participants engage in a variety of actions, technologies, and procedures known as telemedicine (Balestra, 2018). Moreover, it is a remote consultation for diagnosis or treatment between a patient and an expert that utilizes contemporary telecommunications technologies (Snyder & Kerns, 2021). The ability to receive patients remotely while maintaining patient safety, the issuance of electronic prescriptions for drugs and medical supplies, quick consultations in real-time, the holding of councils, online seminars, video lectures, and conferences, the ability to dynamically monitor patients' health regardless of distance, and expert video consultations involving specialists from other cities and regions are just a few of the benefits of telemedicine (Balestra, 2018). As many patients with respiratory illnesses as possible are being seen remotely by nurses thanks to telemedicine technology, especially the elderly and immunocompromised patients who are most at risk of catching the coronavirus.

For patients receiving care who cannot or do not want to leave their homes owing to their health, online consultations boost access to medical care. Also, rural patients who reside in isolated communities and have little access to healthcare can be reached through this type of communication. With the use of telemedicine equipment, it is feasible to significantly alter who has access to care in a variety of dire situations. Medicare users, for instance, can make use of virtual health services like Medicare telemedicine visits, virtual registrations, and e-visits, which expands simultaneous customer access to healthcare services, lowers expenses, and eases the workload of nurses (Hamadi et al., 2022). Telemedicine is therefore a

successful method of delivering medical care, particularly outpatient care, which considerably increases access to healthcare services for a variety of patients.
